

**Question for written answer E-001060/2020
to the Commission**
Rule 138
Daniel Buda (PPE)

Subject: Impact of global warming on agriculture

Climate change is having an increasingly adverse effect on the ability of many regions in the world to produce food. More particularly, climate change will have an uneven impact on global agriculture, improving production conditions in some regions and exacerbating them in others, hence generating both gains and losses.

Overall, global warming will lead to a series economic and food gaps which are much larger and more serious than those that already exist between developed and less-developed or developing regions and countries. It must be ensured that trade developments and expansion are managed fairly and are mainly aimed at eliminating hunger, food insecurity and malnutrition, so as to prevent the widening of economic and food gaps.

What is the Commission's position on the impact of global warming on countries around the world?

How will it combat global warming and how can it support the countries which are and will continue to be most affected by global warming?
